Abstract

Here, we apply natural metrics defined in the space of Keplerian orbits to search for asteroids in close orbits. First, we use as a metric the distance between two orbits in the five-dimensional space of Keplerian orbits. Then, we apply the distance in three-dimensional factor-space of positional orbital elements. We have identified new asteroid pairs with a possible common origin. Once the asteroid pairs candidates are identified, we analyze their dynamical evolution. We find that the Yarkovsky effect must be taken into account when carrying out high-accuracy numerical simulations of the orbital evolution of asteroid pairs. Finally, we consider the planning of follow-up astrometric and photometric observations of the candidate asteroid pairs to determine their rotational parameters, needed to modeling the Yarkovsky effect.

Keywords: asteroids, metric, asteroid pairs, asteroid families

1. Introduction

The distribution of asteroid orbits in the Solar System is the result of various processes that shaped it over time (see e.g. Deienno et al., 2016; Granvik et al., 2017). It has been showed by Vokrouhlický & Nesvorný (2008) that a large number of asteroid pairs exist in the main belt. In these cases, both asteroids in
