Highlights

- Nutrition screening is an initial step in malnutrition identification.
- Nutrition intervention and monitoring are essential components following nutrition screening.
- This cyclical process helps to improving patient outcomes.

Abstract

Introduction

Nutrition screening is an initial procedure in which the risk of malnutrition is identified. The aims of this review were to identify malnutrition risk from nutrition screening studies that have used validated nutrition screening tools in community living older adults; and to identify types of nutrition interventions, pathways of care and patient outcomes following screening.
