This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

A multi-omics analysis of the regulatory changes induced by miR-223 in a monocyte/macrophage cell line.

Sources of funding.

This work was funded by grant MIRNA from the Picardie Regional Council, including post-doctoral fellowships for EMM and LL.

Acknowledgements.

We thank Stéphanie Guénin from CRRBM for technical help concerning transcriptomics experiments, and Benjamin Brigant for help with figure design.

Highlights of miR-223 and multi-omics analysis

We used a multi-omics approach to study the impact of miR-223 in the RAW cell line.

We evidenced changes linked to cell death, histone acetylation, bone remodeling, RNA regulation.
