This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Aggressive Triple Negative Breast Cancers have unique molecular signature on the basis of mitochondrial genetic and functional defects.

RUNNING TITLE: TNBCs have higher prevalence of mitochondrial defects.

KEY WORDS: mitochondrial DNA copy number; mitochondrial DNA sequence imbalance; metabolic gene expression; triple negative breast cancer; ESRP1.

CONFLICT OF INTEREST: The authors have no conflict of interest.
