Prolonged exposure to $1,25(OH)_2D_3$ and high ionized calcium induces FGF-23 production in intestinal epithelium-like Caco-2 monolayer: A local negative feedback for preventing excessive calcium transport

Mayuree Rodrat, Kannikar Wongdee, Natthaphon Panupintu, Jirawan Thongbunchoo, Jarinthorn Teerapornpuntakit, Nateetip Krishnamra, Narattaphol Charoenphandhu

PII: S0003-9861(17)30606-9

DOI: 10.1016/j.abb.2017.12.022

Reference: YABBI 7624

To appear in: Archives of Biochemistry and Biophysics

Received Date: 30 August 2017

Revised Date: 19 November 2017

Accepted Date: 7 December 2017

Please cite this article as: M. Rodrat, K. Wongdee, N. Panupintu, J. Thongbunchoo, J. Teerapornpuntakit, N. Krishnamra, N. Charoenphandhu, Prolonged exposure to 1,25(OH)₂D₃ and high ionized calcium induces FGF-23 production in intestinal epithelium-like Caco-2 monolayer: A local negative feedback for preventing excessive calcium transport, *Archives of Biochemistry and Biophysics* (2018), doi: 10.1016/j.abb.2017.12.022.

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.
