54 1. Introduction

55 Adipose tissue is not only an energy storage, but also the largest en-
 56 docrine organ in the body. The fat factors (adipokines), secreted by the
 57 adipose tissue, include dozens of members, such as leptin, adiponectin,
 58 resistin glycolipids, tumor necrosis factor, interleukin-6, visfatin,
 59 omentin and retinol binding protein. These factors participate in various
 60 physiological and pathophysiological processes in the body involved in
 61 energy metabolism, lipid metabolism and inflammatory responses in
 62 cardiovascular system [1]. However, few of these adipokines play a
 63 role in the positive metabolism promoting good health. Omentin is a re-
 64 cently identified novel adipocytokine, and belongs to the category of
 65 good adipokines. Plasma omentin levels are significantly decreased in
 66 patients with obesity, insulin resistance, and diabetes that contribute
 67 to the major components of the metabolic syndrome and other disease
 68 conditions like atherosclerosis, coronary artery disease (CAD) and heart
 69 failure, etc. [2]. This review expands upon several papers [3–5] that
 70 provided commentaries on specific aspects of omentin biology and
 71 functions in cardiovascular disease (CVD).

72 2. Omentin structure and distribution

73 Omentin was identified in an omental fat cDNA library in 2005 [6,7]
 74 and was initially described in intestinal Paneth cells [8,9] with the name
 75 intelectin-1 and intestinal lactoferrin receptor [9,10]. It was also detect-
 76 ed in endothelial cells and referred to as endothelial lectin [10]. Omentin
 77 is composed of 313 amino acids, and mainly expressed in visceral adipo-
 78 se tissue. More specifically, it is expressed in visceral adipose stromal
 79 vascular cells, rather than in subcutaneous adipose tissue [7]. Omentin is
 80 encoded by 2 genes, omentin-1 and omentin-2, and the former is the
 81 major circulating form. Omentin-1, with uniprot code Q8WWAO and
 82 gene bank expression number AY549722, has been more intensively
 83 studied than omentin-2 [11]. In this article, we refer to omentin-1 as
 84 omentin.

85 Omentin, a hydrophilic protein with a molecular weight of 35 kDa, is
 86 scarce in subcutaneous fat depots and mature adipocytes, and specif-
 87 ically secreted from the stromal vascular cells within the fat depots. It
 88 is also expressed in other tissues, such as endothelial cells, epicardial
 89 fat, thymus, small intestine, colon, reticulocytes, ovary, lungs and placen-
 90 ta [6,7].

91 Omentin-1 is a new type of Ca²⁺-dependent lectin with affinity for
 92 galactofuranosyl residues [6]. It may therefore be implicated in the re-
 93 cognition of specific pathogens and bacterial components [12]. Omentin-
 94 2 is a homolog of omentin-1 with 83% of amino acid identity. The genes
 95 of these two homologs are adjacent to each other in the 1q22–q23

chromosomal region linked to type-2 diabetes mellitus (T2DM) in
 several populations [13] (Table 1).

3. Omentin and inflammation

98 Accumulating evidence indicates that the obese state is character-
 99 ized by chronic low-grade inflammation, which leads to the initiation
 100 and progression of obesity-related disorders, such as T2DM, hyper-
 101 tension, CVD, and atherosclerosis. Omentin, as a newly discovered
 102 adipokine, plays an anti-inflammatory role, as reported by several
 103 groups [11,14,15]. In addition, the role of omentin has been implicat-
 104 ed in the gut defensive mechanism to pathogenic bacteria such as
 105 *Escherichia coli* [6]. Rheumatoid arthritis, another studied inflamma-
 106 tory condition, has low omentin levels in synovial fluid when com-
 107 pared with healthy condition, suggesting that omentin can be a
 108 possible biomarker for degenerative process in osteoarthritis [16].
 109 The gene expression of omentin is enhanced in the airway epithelial
 110 cells of patients with asthma [17,18]. Lower levels of omentin in
 111 smokers seem to be related to a susceptibility of infections. Omentin
 112 levels are decreased in psoriasis, but increased levels of omentin in
 113 psoriatic arthritis [19]. Turkcu et al. [20] demonstrated that the plas-
 114 ma omentin level was decreased, whereas the TNF- α levels and TNF-
 115 α /omentin ratio were increased in Behcet disease patients. The ratio
 116 may be used in the presentation of deviation in the inflammatory
 117 and anti-inflammatory balance in Behcet disease. The elevation of
 118 omentin levels in rats was observed in the early stage of pancreatitis.
 119 The elevated omentin levels improved insulin resistance and caused
 120 a significant reduction in glucose levels [21].

121 It remains challenging to determine the inflammatory activity in
 122 Crohn's disease (CD) due to the lack of specific laboratory markers.
 123 Recent studies suggest that serum omentin is associated with inflama-
 124 tory response. The serum and colonic omentin expression is de-
 125 creased in active CD patients. The correlation of serum omentin
 126 with disease activity of CD is superior to that of C-reactive protein.
 127 Serum omentin is a potential marker for CD disease activity [6,22].
 128 Background inflammation is involved in the mechanism of inflamma-
 129 tory bowel disease (IBD). Decreased serum omentin levels could be
 130 considered as an independent predicting marker of the presence
 131 and disease activity of IBD [23,24]. In a recent study of acute mesen-
 132 teric ischemia (AMI), Sit and colleagues [25] demonstrated that
 133 serum omentin level in sham group was significantly elevated com-
 134 pared to rats in ischemia–reperfusion group. Acute mesenteric ische-
 135 mia is an intestinal vascular disease with high mortality. Clinical
 136 diagnosis of acute mesenteric ischemia is difficult. Serum omentin
 137 level may predict early diagnosis of acute mesenteric ischemia before
 138 development of transmural ischemia. Omentin levels may be a bio-
 139 chemical indicator to detect acute mesenteric ischemia. However,
 140 further human studies are needed.

141 Omentin is also increased in non-alcoholic fatty liver disease
 142 (NAFLD), and is an independent predictor of hepatocyte ballooning
 143 [26]. This finding appears controversial, because non-alcoholic fatty
 144 liver disease is mostly found in obesity, which has been linked with
 145 low levels of omentin (see below). Furthermore, patients with end
 146 stage renal disease who are in haemodialysis have higher levels of
 147 omentin versus control subjects [27]. The patients with diabetes
 148 mellitus (DM) have lower levels of omentin than patients with end
 149 stage renal disease on haemodialysis without DM. Pregnant women
