This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

18 **Abstract**

19 The molecular mechanism of the local hypersensitivity reactions to wasp venom including
20 dermal necrosis remains an enigma regardless of the numerosity of the reported cases. In this
21 study, we discovered a new membrane disrupting toxin, VESCP-M2 responsible for tissue
