This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

1 SHORT COMMUNICATION

2 **Multi-copy venom genes hidden in *de novo* transcriptome assemblies, a cautionary tale with**
3 **the snakelocks sea anemone *Anemonia sulcata* (Pennant, 1977)**

8 **Abstract**

9 Using a partial transcriptome of the snakelocks anemone (*Anemonia sulcata*) we identify
10 toxin gene candidates that were incorrectly assembled into several Trinity components. Our
11 approach recovers hidden diversity found within some toxin gene families that would otherwise
12 go undetected when using Trinity, a widely used program for venom-focused transcriptome
13 reconstructions. Unidentified hidden transcripts may significantly impact conclusions made
14 regarding venom composition (or other multi-copy conserved genes) when using Trinity or other
15 *de novo* assembly programs.

16 **Keywords**

17 Next Generation Sequencing; Trinity; Sodium Channel Toxins; sea anemone venom;
