This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Reduced cellular DNA repair capacity after environmentally relevant arsenic exposure. Influence of *Ogg1* deficiency

Running title: DNA repair capacity after chronic arsenic exposure.

Highlights

- Repair ability under long-term exposure to arsenic was tested using the comet assay.
- Effects were measured under *Ogg1* wild-type and deficient backgrounds.
