This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Proportional-piling enables to rank as well as estimate relative weights of traits
- A fair congruence observed between economic values and farmers' weightings of traits
- Farmer weightings can be used to construct SI in the absence of economic weights
- A complementary use of farmers' preferences and bio-economic modelling is suggested
