This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Supplementing a sensory additive increased milk production and energy corrected milk yield
- Animals supplemented with a sensory additive showed higher grazing time and biting rate compared with control animals
- Total ruminating time was the highest in animals supplemented with a sensory additive, mainly explained by a longer ruminating time after morning milking.
