This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The diet containing protected fat increased CLA in the muscle, compared to the other diets.
- The C18 Δ^9 -desaturase index was higher in the muscle of feedlot-finished bulls, compared to pasture-finished animals.
- The diet containing protected fat decreased the elongase concentrations, compared to the other diets.
- Pasture-finished bulls fed lipid-supplemented diets had higher fatty acid concentrations in muscle.
