To enable discussion of all aspects of emerging virus infections, an Emerging Viruses meeting was held at the University of Nottingham, UK, on 27-29 July 2015. Given the success of this meeting, a second meeting was organised, now called 'Emerging Viruses of Zoonotic and Veterinary Importance', at Churchill College, Cambridge, UK, on 24-26 July 2017 to encourage discussion of emerging virus infections from a One Health perspective.

Infectious disease not only affects human health, but has an impact on the stability of food production and the survival of wild species. This is formulated in the One Health approach to infectious disease, where the possibility of infectious agent movement between species, including human beings, is key. Whilst a major driver of emerging virus disease research is public health concern over zoonotic infections, there are also veterinary drivers for emerging viral diseases. Such diseases may have devastating effects
