**Abstract:** Flash NanoPrecipitation (FNP) is a scalable approach to generate polymeric nanoparticles using rapid micromixing in specially-designed geometries such as a confined impinging jets (CIJ) mixer or a Multi-Inlet Vortex Mixer (MIVM). A major limitation of formulation screening using the MIVM is that a single run requires tens of milligrams of the therapeutic. To overcome this, we have developed a scaled-down version of the MIVM, requiring as little as 0.2 mg of therapeutic, for formulation screening. The redesigned mixer can then be attached to pumps for scale-up of the identified formulation. It was shown that Reynolds Number allowed accurate scaling between the two MIVM designs. The utility of the small-scale MIVM for formulation development was demonstrated through the encapsulation of a number of hydrophilic macromolecules using inverse Flash NanoPrecipitation with target loadings as high as 50% by mass.

**Keywords:** Nanoparticles, Mixing, Protein Delivery, Peptide Delivery, Formulation, Particle Size, Polymeric Drug Carrier

### Abbreviations:

FNP – Flash NanoPrecipitation  
CIJ – Confined Impinging Jets mixer  
MIVM – Multi-inlet Vortex Mixer  
NP(s) – nanoparticle(s)  
BCP – block copolymer  
PS-PEG (PS-*b*-PEG) – poly(styrene)-*block*-poly(ethylene glycol)  
PS – poly(styrene)  
THF – tetrahydrofuran  
Re – Reynolds Number (Equation 1)  
iFNP – inverse Flash NanoPrecipitation  
 $\mu$ MIVM – micro Multi-Inlet Vortex Mixer  
CHCl<sub>3</sub> – chloroform  
DMSO – dimethyl sulfoxide  
HPLC – high-performance liquid chromatography  
PS-*b*-PAA – poly(styrene)-*block*-poly(acrylic acid)  
DLS – dynamic light scattering  
CONTIN – algorithm name  
PDI – polydispersity index  
OVA – ovalbumin  
HRP – horseradish peroxidase  
MeOH – methanol  
PAA – poly(acrylic acid)  
SD – standard deviation
