\*Article presented at Monothematic meeting of *Société française d'anesthésie et de réanimation (Sfar)*: « Urgence, anesthésie et réanimation de la femme enceinte », Paris, May 16, 2016.

\*\*This article is published under the responsibility of the Scientific Committee of the « *Journée monothématique 2016 de la Sfar* ». The editorial board of the Anaesthesia Critical Care & Pain Medicine was not involved in the conception and validation of its content.

**Points essentiels**

- Any dyspnoea, chest pain, syncope or collapsus must alert women health care providers to engage rapidly the diagnosis process and emergent treatment of the cardio-circulatory failure.
- The larger competence of the obstetric anaesthetists to perform echographic diagnosis at the parturient bedside helps to a more rapid management than previously.
- Symptomatic and etiologic treatments must be applied without delay induced by the pregnant status and obstetrical manoeuvres.
