ABSTRACT

Objective

The objective of this study was to examine the sociodemographic, clinical, and behavioral factors associated with excessive sitting time in persons with multiple sclerosis (MS).

Methods

Useful data were obtained from 6483 persons with MS who completed the semi-annual survey of the North American Research Committee on Multiple Sclerosis registry conducted in the spring of 2015. Sociodemographic, clinical, and behavioral data were collected using self-report questionnaires. Sitting time per day was determined using the International Physical Activity
