Title: Nasal High-Frequency Oscillatory Ventilation Inhibits Gastroesophageal Reflux in the Neonatal Period

Authors: Danny Cantin, Djamel Djeddi, Nathalie Samson, Charlène Nadeau, Jean-Paul Praud

PII: S1569-9048(17)30441-X
DOI: <https://doi.org/10.1016/j.resp.2018.02.003>
Reference: RESPNB 2923

To appear in: *Respiratory Physiology & Neurobiology*

Received date: 13-12-2017
Revised date: 6-2-2018
Accepted date: 8-2-2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Nasal High-Frequency Oscillatory Ventilation Inhibits Gastroesophageal Reflux in the Neonatal Period

No reprints will be ordered

Highlights

- Nasal high-frequency oscillatory ventilation inhibits gastroesophageal reflux.
- Nasal high-frequency oscillatory ventilation increases gas-containing swallows.
- Nasal high-frequency oscillatory ventilation does not alter non-nutritive swallows.
