This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

#### ACCEPTED MANUSCRIPT

### 1 CAPSULE SUMMARY

- Some pediatric subungual atypical lentiginous melanocytic proliferations are difficult to
  classify.
- We describe 11 lesions characterized by changing melanonychia, poor circumscription,
  lentiginous growth, and cytologic atypia. One displayed 11q13 gain.
- Despite elusive biologic potential, these lesions are histologically indistinguishable from
  adult melanoma in situ. Complete excision is recommended.
