This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

1. Dietary, social and health patterns are associated with the area of residence.
2. Number of variables needed to assess this association can be significantly reduced.
3. The caloric intake, the number of diseases, and the need of assistance, are highlighted.
4. Metropolitan areas are related to worse health status and lower caloric intake.
5. Rural areas are consequently related to lower need of assistance.
