This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- There is a direct relationship between the highest versus lowest DII scores and the prostate cancer risk in men
- There is an association between higher DII score and increased breast cancer risk among premenopausal women, but not in postmenopausal women
- Body mass index have positive associations with the relationship between DII score and breast cancer risk among women
- There is no significant association between the highest versus lowest DII score and breast cancer risk among women who underwent hormone therapy
