Conflict of interest statements: None

A 53-year-old man presented to the emergency department with a 1-day history of persistent lower abdominal pain. The pain started after a diagnostic colonoscopy, which went smoothly and uneventfully without anesthesia one day earlier, and there was no history of trauma. Physical examination revealed a significantly swelling penis and scrotum with purple discoloration, as well as dispersed ecchymosis in the right lower quadrant abdomen, which indicated severe hemorrhage in the skin and subcutaneous tissue (A). Abdominal palpation indicated tenderness but no rebound
