Short Title: Alarming trends

Long term (7 or more years) outcomes of the sleeve gastrectomy: a meta-analysis

Background: The laparoscopic sleeve gastrectomy is now the most common bariatric operation in the United States, and has become an established procedure in the armamentarium of the bariatric surgeon. However, this has happened without the strong support of long term outcomes data, namely the rate of revision and durability of the weight loss. Newly published data from around the world is starting to show alarming trends in these two areas. This paper will examine the published and presented data with at least a 7 year follow up.

Objectives: This is a meta-analysis on published data with at least 7 years of follow up from the laparoscopic sleeve gastrectomy.
