Abstract

Endoscopic eradication therapy (EET), the standard of care for treatment of Barrett's esophagus with dysplasia and early neoplasia, consists of a combination of endoscopic resection and ablative modalities. Resection techniques primarily include endoscopic mucosal resection or endoscopic submucosal dissection. Resection of nodular disease is generally followed by one of multiple ablative therapies among which radiofrequency ablation has the best evidence supporting safety and efficacy. These advanced endoscopic procedures require both experience and expertise in the cognitive and procedural aspects of EET. However, very few formal programs exist that teach endoscopists the necessary skills to perform EET in a safe, standardized, and efficacious
