4 **Abstract** In this paper, we formulate a six dimensional drug transmission model to study
5 the effect of family education and public health education. The dynamical behaviors of
6 the model are discussed in terms of the basic reproduction number R_0 . By constructing
7 Lyapunov functions, we obtain the drug-free equilibrium is globally asymptotically stable
8 if $R_0 \leq 1$ and the drug addiction equilibrium is globally asymptotically stable if $R_0 > 1$.
9 Sensitivity analyses are performed to seek for effective control measures for drug spread. The
10 analysis show that both the family and public health education can influence the spread of
11 drug transmission. However, the combination of family and public health education is more
12 effective to reduce the prevalence of drugs. Some numerical simulations are given to confirm
13 the obtained theoretical results.

17 **1 Introduction**

18 Drug abuse is one of the most serious health and social problems around the
19 world and has attracted governments' attentions. More and more people are infected
20 by various drugs. Curiosity, thrill, seeking negative mentality and environmental
21 impact are the main key factors to tempt susceptible individuals to contact with
22 drugs. The U.S. Centers for Disease Control and Prevention in 2015 reported that
23 from 2002 to 2013, the number of Americans over the age of 12 who snort heroin
