**ABSTRACT**

Introduction: Head and neck cancer recurrence is a therapeutic challenge due to the anatomical and functional constraints of the head and neck area. Stereotactic body radiotherapy (SBRT) is a high-precision technique of radiotherapy that consists of delivering a high ablative biological dose in 1 to 5 high-dose fractions, requiring a very high precision of the radiotherapy process with potential application in this clinical setting.

Methods: Different studies that investigate the role of SBRT in the treatment of recurrent head and neck cancer have been reviewed. Indications to properly select patients for this treatment are presented.
