ABSTRACT

Objective:

The safety and effectiveness of clinical transfusion are highly associated with clinical blood transfusion level. A survey was conducted with the aim of providing references to improve the level of clinical blood transfusion.

Study Design and Methods:

A survey was undertaken by means of a questionnaire which consisted of hospitals' basic conditions, utilization of blood products and application of autologous blood transfusion in hospitals with scale, geographic and religious diversity in Sichuan, China. Data analysis was conducted in 3 groups according to the official classification of hospital.
