This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Iclaprim was noninferior to vancomycin for early clinical response at the early time point in two Phase 3 studies for the treatment of skin infections
- Iclaprim was active against skin infections caused by MRSA, *S. pyogenes* and other Gram-positive pathogens
- Iclaprim was safe and well tolerated compared to vancomycin except for a higher incidence of nephrotoxicity reported for vancomycin
