Highlights

- • Large cross sectional community prevalence serosurvey of Hepatitis B was conducted among children aged 1-14 years in Guangdong province in the year 2013.
- • The prevalence of HBsAg among children aged 1-14 in Guangdong decreased dramatically from 19.9% to 1.2% during the past 20 years.
- • High vaccination coverage among children and timely vaccination for newborns played an important role in reducing the prevalence of HBsAg.
