Highlights

- This study is the first meta-analysis of the resistance of clinical *Enterococcus* isolates in Turkey to antibiotic agents.
- In order to support the practice of evidence-based medicine, more notifications about *Enterococcus* resistance status are needed, especially notifications following the ASP rules.
- The most important component of the study, which has the goal of preventing the spread of antibiotic resistance, is to increase access to data from evidence-based studies. Therefore, within the framework of preventive practices, resistance development should be notified and ASP policy should be applied.
