This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

TITLE

Trunk, pelvis and hip biomechanics in individuals with femoroacetabular impingement syndrome: strategies for step ascent

Highlights

- Individuals with FAI syndrome exhibit altered biomechanics during step ascent.
- Alterations relate primarily to pelvis control in the frontal plane.
- FAI patients implement a range of proximal strategies which may relate to symptoms.
- Interventions targeted at adjacent segments may be relevant for management of FAI.
