Summary

Introduction

Gender dysphoria is defined as one's belief that his/her body does not reflect his/her true "inner" identification of physical sex and requires medical and/or surgical treatment that will alter his/her body to better reflect what he/she believes is his/her true gender.

Objective

The aim was to describe current surgical techniques available in genital reconstruction for female-to-male (FTM) and male-to-female (MTF) transgender patients.

Study design

We reviewed recently published papers concerning the most common procedures in genital reconstruction in FTM transgenders and in MTF transgenders.
