This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlight

- A low dose of ketamine infusion did not impair cognitive function in patients with TRD.
- Specific cognitive improvement measured using the go/no-go task was observed among the responders in the 0.5-mg/kg ketamine infusion group.
- Additional studies are required to clarify the beneficial or harmful effects of repeated ketamine infusion on the cognitive function of patients with TRD.
