This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Higher plasma EPA levels and higher serum lithium levels may be associated with less suicide attempt.
- Higher plasma arachidonic acid levels may be associated with more deliberate self-harm.
- As naturally absorbed nutrients, low arachidonic acid levels may be effective for deliberate self-harm while high EPA and high lithium levels may be effective for suicide attempts.
