This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- No statistically significant influence of mental health care variables on SMR remained after correcting for country, time and economic variables
- Available data predicted less than 10% of the variability of the suicide mortality rate.
- Further research is needed to implement preventive measures for individuals at risk of suicide.
