This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Divorced men of all ages and men aged more than 75 years faced high suicide risks.
- Never-married men aged 55–64 years faced high suicide risks.
- Never-married women with low educational levels faced high suicide risks.
- Suicide risk for divorced people was 5.44 times higher than among married people.
- Study extends prior research and aids efforts to reduce suicide mortality in Korea.
