This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Sex and age differences in the role that life circumstances play in the risk for firearm suicide is proposed.
- Having a recent crisis increased the risk in all sex-age groups.
- Physical health problems drove the risk of using firearms among older men .
