This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- Previous psychiatric history increases the odds of depression in people with AD
- Cognitive and functional decline are associated with increased risk of onset of clinically significant symptoms of depression in AD, alongside younger age and neuroticism
- Future research should use either diagnostic criteria or instruments that are validated for depression in this population
