**\*Corresponding author:**

Shintaro Kuroda

**Highlights**

- Although von Willebrand disease (VWD) is a common inherited bleeding disease, only 1 case of hepatectomy in a patient with VWD has been described.
- Perioperative hemostatic management is important especially in patients with VWD undergoing surgery because of the dysfunction of the platelet and destabilization of the blood clotting factor VIII.
- The patient was successfully treated by administering factor VIII/von Willebrand factor concentrate and by measuring activated partial thromboplastin time as an index for perioperative hemostatic management.

**ABSTRACT**

**INTRODUCTION:** Although von Willebrand disease (VWD) is a common inherited
