Highlights:

- • Perforation due to an ingested foreign body can occur at some point of physiological narrowing or angulation of the intestinal lumen, such as the ileocecal and rectosigmoid junctions.
- • We experienced an unusual case of malignant lymphoma incidentally diagnosed after perforation of the jejunum by a fish bone
- • In cases of perforation of the jejunum with an ingested foreign body, careful observation during the surgery may be needed in order to avoid missing the accompanying malignancy.
