This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Electrocorticographic telemetric recording in unrestrained mouse pups.

Highlights

- We applied telemetry techniques to record unrestrained mouse pups starting P13
- The surgical procedure was well tolerated, with limited mortality
- The quality of signal was good and pups can be recorded in their normal breeding conditions
- Mice can be recorded up to two months of age with no alteration of the signal
