This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- Multiphase model of smooth muscle cell response to PDGF in atherosclerotic plaques
- Boundary conditions capture cell migration from media and PDGF influx from lumen
- Smooth muscle cell proliferation makes limited contribution to cap formation
- Stable cap requires critical balance between cell recruitment, migration and death
- Excessive PDGF production reduces efficiency and efficacy of cap formation
