This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Six models of cancer growth with a public goods game under immune system suppression are explored.
- We show how cheaters are beneficial to the population as a whole.
- Under a linear benefit function, the cancer cells face a threshold Volunteer's Dilemma whereby a threshold of cooperation is required to escape immune system suppression.
- Under the nonlinear Monod function, optimal growth of the tumor occurs for a mixture of altruists and cheaters.
