Epidemicity thresholds for water-borne and water-related diseases

Lorenzo Mari, Renato Casagrandi, Andrea Rinaldo, Marino Gatto

PII: S0022-5193(18)30138-3
DOI: [10.1016/j.jtbi.2018.03.024](https://doi.org/10.1016/j.jtbi.2018.03.024)
Reference: YJTBI 9401

To appear in: *Journal of Theoretical Biology*

Received date: 4 August 2017
Revised date: 2 February 2018
Accepted date: 16 March 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Water-borne and water-related diseases represent a serious threat to human health
- Short-term epidemic outbreaks may pose difficult challenges for control
- Conditions for transient epidemicity can be determined via g-reactivity analysis
- Epidemicity thresholds are given for cholera, schistosomiasis, malaria and dengue
- Epidemicity indices represent an important complement to endemicity measures like R_0
