Control of Cell Fraction and Population Recovery during Tissue Regeneration in Stem Cell Lineages

Marissa Renardy, Alexandra Jilkine, Leili Shahriyari, Ching-Shan Chou

PII: S0022-5193(18)30077-8
DOI: [10.1016/j.jtbi.2018.02.017](https://doi.org/10.1016/j.jtbi.2018.02.017)
Reference: YJTBI 9360

To appear in: *Journal of Theoretical Biology*

Received date: 3 August 2017
Revised date: 24 January 2018
Accepted date: 19 February 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Three variants of a stem cell lineage model are presented and compared.
- Parameter sensitivity analysis is performed for different performance objectives.
- Feedback on stem cell replication is required for control of stem/TA cell ratio.
- Feedback on stem cell division rate reduces amplitude of oscillation.
- Feedback on cell division rates and stem cell replication gives robust behavior.
