This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- We have presented a new predictor RBSURFpred, which extends a previous predictor, REGAd<sup>3p</sup> on several dimensions by incorporating 58 physicochemical, evolutionary and structural properties into 9-tuple peptides via Chou's general PseAAC, which allowed us to obtain higher accuracies in predicting both real-valued and binary ASA.
- The proposed tool named RBSURFpred is built using the regularized exact regression technique with higher-order polynomial function as kernel to fit non-linear feature space.
- We have incorporated 3 important features of a protein residue to predict its exposure to solvent that have not been explored before for this application.
- RBSURFpred resulted in promising performance when compared with two other existing state of the art predictors in the literature.
