This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Insoluble substrate implies need for kinetic theory of enzyme-substrate interactions.
- A simple, biochemically motivated model is proposed, where enzymatic degradation of substrate at the interface makes substrate at the bulk accessible.
- Closed form, time dependent solutions are derived, valid for all initial conditions and rate constants.
- The model merge with the Michaelis-Menten equation and the reverse Michaelis-Menten equation in case of respectively substrate excess and enzyme excess.
- Parameter estimation and experimental setup is analyzed, showing how all parameters can be reliably estimated.
