

Extracellular volume depletion and resultant hypotonic hyponatremia:
a novel translational approach

Philip J.G.M. Voets , Roderick P.P.W.M. Maas

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Intravascular volume depletion is a common problem in everyday clinical practice.
- Hypovolemia-triggered vasopressin release induces hypotonic hyponatremia.
- We present a theoretical model that describes the relationship between volume depletion and hyponatremia.
