This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Framework for filling groundwater level observation gaps in highly dynamic aquifers
- Utilization of both direct and auxiliary information
- Low computational cost by combining stochastic modeling and the Ensemble Smoother
- Transferable scheme that does not require geologic or soil property data
