This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**HIGHLIGHTS**

- Extensive roots, high biomass and growth are critical to effective nitrogen removal
- Plant nitrogen assimilation is a key driver, occurring alongside high water uptake
- High root length key trait in both wet and dry conditions
- Very low water loss also beneficial in dry
- Decision-support tool developed to facilitate species selection
