Partitioning Uncertainty in Streamflow Projections under  
Nonstationary Model Conditions

Ila Chawla , P.P. Mujumdar

PII: S0309-1708(17)30017-9  
DOI: [10.1016/j.advwatres.2017.10.013](https://doi.org/10.1016/j.advwatres.2017.10.013)  
Reference: ADWR 2976

To appear in: *Advances in Water Resources*

Received date: 6 January 2017  
Revised date: 6 September 2017  
Accepted date: 9 October 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Effect of model stationarity assumption on streamflow simulation is examined.
- Approach to obtain nonstationary hydrologic model parameters is presented
- Contribution of (i) GCMs, (ii) emission scenarios, (iii) land use, (iv) assumption of hydrologic model parameters to be stationary or nonstationary, and (v) internal variability of the system to uncertainty in the streamflow is quantified.
- GCMs and assumption of nonstationary and stationary model parameters are observed to be the primary source of uncertainty.
- Streamflow is observed to be sensitive towards the subtle changes in the land use.
